SUMMARY

Frontend developer specialized in React, with hands-on experience building REST API-driven platforms that connect customers and vendors. I have experience in structuring projects with decoupled data layers, so a real backend can be dropped in later without rewriting the UI. I am comfortable in fast-moving startup environments with Git/GitHub workflows, code reviews, and async collaboration, and productive with AI coding tools (Claude, GPT) as part of my daily workflow. Looking to bring strong React fundamentals and an end-to-end ownership mindset to a team building real-world impact technology.

TECHNICAL SKILLS

- **Core:** React, JavaScript (ES6+), TypeScript, HTML, CSS
- **APIs & Data:** REST API integration, Tanstack, Axios, Fetch API, async data handling, loading/error states, API-ready data architecture
- **State & Routing:** React Hooks (useState, useEffect, useContext), React Router, Zustand
- **Styling:** Tailwind CSS, responsive mobile-first design, CSS @layer components
- **Tooling & Workflow:** Vite, Git/GitHub (branching, PRs, code reviews, merge conflict resolution), ESLint, Vercel
- **AI-Assisted Development:** Claude, GPT, Cursor — used daily for code review, debugging, and shipping faster

EXPERIENCE

Ensitu Gems & Jewelry – Frontend Engineer – Remote

Nov 2025 – Dec 2025

- Architected a 15-page e-commerce frontend covering product catalog, shopping cart, and multi-step checkout, which was delivered on time to the client's specifications.
- Implemented secure authentication with separate flows for authenticated vs. guest users and persistent session state via Context API.
- Built order management UIs, including real-time order tracking, wishlist, and order history dashboards, wired to backend REST APIs.
- Integrated multiple payment gateways with dedicated interface pages, structured error handling, and comprehensive state management for loading/success/failure flows.
- Collaborated with backend developers via Git branching workflow — code reviews, PR conventions, and merge conflict resolution.

PROJECTS

Kandy Baby Store – Multi-Vendor E-Commerce Platform – kandy-store.vercel.app

React · JavaScript · Tailwind CSS · React Router · Vercel · Resend

- Architected a full multi-vendor platform with vendor dashboards, product listings, cart management, and multi-step checkout, which I deployed on Vercel.
- Built a centralized siteData.js content layer, decoupling all client-facing copy from component logic, enabling zero-code content updates.
- Engineered serverless order notification system via Vercel API routes with Resend, input validation, and structured error handling.
- Delivered scroll-triggered FadeIn animations using raw IntersectionObserver, no animation libraries, full performance control with willChange and rootMargin tuning.
- Maintained production-grade codebase: ESLint, .env.example, vercel.json, SPA rewrites, and documented README.

Kelijah Auto Spares & Garage — kelijah.vercel.app

React · Vite · Tailwind CSS · React Router · Vercel

- Built a customer-to-vendor booking platform connecting customers with garage services via a structured WhatsApp booking flow, mirroring real-world service-marketplace UX.
- Designed the listings layer to simulate a backend response: data is fetched from a local module exactly as it would be from an API endpoint, so introducing a real backend later is a drop-in replacement, not a refactor.
- Handled a live production incident: an exposed .env file pushed to GitHub was identified and purged from history using git filter-branch — hands-on Git troubleshooting under real conditions.
- Deployed on Vercel with environment variable management and a clean, maintainable folder structure.

Mwandi's Sneakers — Sneaker Resale E-Commerce Platform (In Progress)

mwandissneakers.vercel.app

React · Vite · Tailwind CSS · React Router · vercel

- Building a full sneaker resale storefront with a category-based catalogue, product detail pages, and a WhatsApp-based ordering flow with M-Pesa payment.
- Applied the same API-ready data architecture used across other projects: catalogue and order data are structured and fetched as if from a backend, so the UI requires no changes once real endpoints exist.
- Currently finalising production content — replacing placeholder product imagery with final photography before full launch; core build, routing, and order flow are complete.

Graken Events – Premium Events & Decor Website – grakenevents.vercel.app

React 18 · Tailwind CSS v4 · React Router v6 · Vercel · Resend

- Built a responsive luxury events platform with reusable React component architecture and structured client-side routing.
- Engineered async contact workflow using Vercel serverless functions and Resend with loading, validation, and inline error states.
- Powered the contact form with Resend so that inquiries submitted by visitors are delivered directly to the business owner's email in real time, removing the need for manual form-checking or a third-party inbox.
- Applied lazy loading, clean state management, Tailwind `@theme{}` design tokens, and scalable code organization for maintainability and performance.

EDUCATION

ALX Software Engineering Program – Front-End Development Specialization

Mar 2025 – Nov 2025

- Intensive program covering modern frontend practices, component architecture, state management, and production-ready code.

KEY STRENGTHS

- Owning projects end-to-end from architecture to deployment
- Designing frontend data layers to be backend-agnostic, minimising rework when real APIs are introduced
- Strong Git discipline: branching, PRs, conflict resolution under real production conditions
- Productive with AI coding tools (Claude, GPT) as part of daily workflow
- Remote-ready, async-first, fast learner expanding into TypeScript and full-stack patterns

Available for full-time remote roles or freelance contracts. Comfortable with async collaboration and international team timezones.
